Regarding: application for potential IT technical/operations support positions

I've loved computer technology and the benefits they bring to us for most of my life, and have recently decided to make a career change in the direction of the IT field. After spending a few years in management, I chose to further this latent interest in IT by attending App Academy's 24-week, 1500+ hour Software Engineering program, which introduces hands-on basics of **Python, Javascript, React, SQLAlchemy, Redux, SQL, Java**, and a few other similar technologies.

In my time as an App Academy student, I worked on several projects independently and within groups using constructive workflows to produce projects as efficiently as reasonably possible. I fell in love with the process of creating and supporting software applications from that point.

After I completed the App Academy training program with one of the highest achievement scores as a student, the academy offered me a position to serve as one of several new instructors there, a position that includes opportunities to improve my own technical skill set and facilitate networking with some of the more seasoned developers there. After accepting the generous offer, I started leadership efforts immediately with two separate cohorts and collaborated with both instructors and administration to improve the already excellent learning experience that the academy fosters and offers to its students. It's worth noting that my efforts to develop and teach curricula for the academy are also helping me to form an even greater appreciation for the depths and nuances of the constantly evolving software engineering field.

Combining my varied experiences with management of time, resources, and people, and including my recently acquired new technical skills, I'm confident that I could be a consistent contributor towards a typical workload within any typical IT support team. As a side note, in preparation for a possible appointment within a typical IT distributed support team, I've been researching VMware and networking tools extensively in my spare time. IT appears to be in my blood, at this point.

Given that Bank of America is truly one of the great companies of the world, I would love to have an opportunity to discuss any open positions further if the skill set represented in the included resume appears to be a good match for the team needs.
